Attempt : 1
Total Mark : 15
Marks Obtained : 12

Section 1 : MCQ

1. What will be the output of the following code?

```
class A {  
    int val = 20;  
}  
  
public class Main {  
    public static void main(String[] args) {  
        A obj1 = new A();  
        A obj2 = obj1;  
        obj2.val += 5;  
        System.out.println(obj1.val);  
    }  
}
```

Answer

20

Status : Wrong

Marks : 0/1

2. What is the output of the following code?

```
class Box {
    int height;
    Box(int height) {
        this.height = height;
    }
    void modifyHeight(Box b) {
        b.height += 10;
    }
}

public class Main {
    public static void main(String[] args) {
        Box b1 = new Box(20);
        b1.modifyHeight(b1);
        System.out.println(b1.height);
    }
}
```

Answer

30

Status : Correct

Marks : 1/1

3. What will be the output of the following code?

```
class Box {
    int length = 5;
    int width = 4;

    int area() {
        return length * width;
    }

    public static void main(String[] args) {
```

```
Box b = new Box();  
System.out.println("Area = " + b.area());  
}  
}
```

Answer

Area = 20

Status : Correct

Marks : 1/1

4. What will be the output of the following code?

```
class Sample {  
    int x = 10;  
  
    void display() {  
        System.out.println("x = " + x);  
    }  
  
    public static void main(String[] args) {  
        Sample s = new Sample();  
        s.display();  
    }  
}
```

Answer

Compile time error

Status : Wrong

Marks : 0/1

5. What will be the output of the following code?

```
class Test {  
    private int value;  
    Test(int value) {  
        this.value = value;  
    }  
    public int getValue() {  
        return value;  
    }  
}
```

```
}  
}  
public class Main {  
    public static void main(String[] args) {  
        Test obj = new Test(10);  
        System.out.println(obj.value);  
    }  
}
```

Answer

Compile-time error

Status : Correct

Marks : 1/1

6. What will be the output of the following code?

```
class A {  
    int y = 30;  
}  
  
public class Main {  
    public static void main(String[] args) {  
        A a1 = new A();  
        A a2 = new A();  
        a1.y = 50;  
        System.out.println(a2.y);  
    }  
}
```

Answer

30

Status : Correct

Marks : 1/1

7. What will be the output of the following code?

```
class Demo {  
    void printMessage() {  
        System.out.println("Hello from Demo");  
    }  
}
```

```
}  
}  
}  
public class Main {  
    public static void main(String[] args) {  
        Demo d = new Demo();  
        d.printMessage();  
    }  
}
```

Answer

Hello from Demo

Status : Correct

Marks : 1/1

8. What will be the output of the following code?

```
class Box {  
    int volume(int l, int b, int h) {  
        return l * b * h;  
    }  
}  
  
public class Main {  
    public static void main(String[] args) {  
        Box b = new Box();  
        System.out.println(b.volume(2, 3, 4));  
    }  
}
```

Answer

24

Status : Correct

Marks : 1/1

9. What will be the output of the following code?

```
class Person {  
    String name;
```

```
void setName(String n) {  
    name = n;  
}  
void printName() {  
    System.out.println(name);  
}  
}  
  
class Test {  
    public static void main(String[] args) {  
        Person p = new Person();  
        p.printName();  
    }  
}
```

Answer

null

Status : Correct

Marks : 1/1

10. What will be the output of the following code?

```
class A {  
    int p = 5;  
    int q = 2;  
}  
  
class Main {  
    public static void main(String[] args) {  
        A obj = new A();  
        System.out.println(obj.p + obj.q);  
    }  
}
```

Answer

7

Status : Correct

Marks : 1/1

11. What will be the output of the following code?

```
class A {  
    int x = 50;  
}  
  
public class Main {  
    public static void main(String[] args) {  
        A obj1 = new A();  
        A obj2 = obj1;  
        obj2.x = 100;  
        System.out.println(obj1.x);  
    }  
}
```

Answer

100

Status : Correct

Marks : 1/1

12. What will be the output of the following code?

```
class Alpha {  
    void greet(String name) {  
        System.out.println("Hello" + name);  
    }  
}  
  
public class Main {  
    public static void main(String[] args) {  
        Alpha obj = new Alpha();  
        obj.greet("Anu");  
    }  
}
```

Answer

Hello Anu

Status : Correct

Marks : 1/1

13. What will be the output of the following code?

```
class Ball {  
    int size = 11;  
}  
  
class Game {  
    public static void main(String[] args) {  
        Ball b1 = new Ball();  
        Ball b2 = new Ball();  
        b2.size = 10;  
        System.out.println(b1.size);  
    }  
}
```

Answer

11

Status : Correct

Marks : 1/1

14. What will be the output of the following code?

```
class MathUtils {  
    int add(int x) {  
        return x + x;  
    }  
}  
  
public class Main {  
    public static void main(String[] args) {  
        MathUtils m = new MathUtils();  
        System.out.println(m.add(5));  
    }  
}
```

Answer

10

Status : Correct

Marks : 1/1

15. What will be the output of the following code?

```
class Person {  
    int age = 18;  
}  
  
public class Main {  
    public static void main(String[] args) {  
        Person p = new Person();  
        p.age += 2;  
        System.out.println("Age: " + p.age);  
    }  
}
```

Answer

Age: 18

Attempt : 1
Total Mark : 10
Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

You are working as a developer for CityBank, which wants to build a basic account management system.

Each customer at the bank has:

An Account Number (integer) A Customer Name (string) An Initial Balance (double)

The bank allows two types of transactions:

Deposit – increases the balance. Withdrawal – decreases the balance only if enough funds are available.

If the withdrawal amount is greater than the balance, the withdrawal should not happen, and the balance should remain the same.

You are required to implement this system using:

A class with attributes for account details. A constructor to initialize account details. Setter methods to update details if needed. Getter methods to retrieve details. Objects of the class to represent customers.

Finally, display each customer's account details after all transactions.

Input Format

The first line of input contains an integer N, representing the number of customers.

For each customer:

- The next line contains the account number (integer).
- The following line contains the customer name (string).
- The next line contains the initial balance (double).
- The next line contains the deposit amount (double).
- The next line contains the withdrawal amount (double).

Output Format

For each customer, print the details in the following format:

1. Account Number: <account_number>
2. Customer Name: <customer_name>
3. Final Balance: <final_balance> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1

1234

Rahul Sharma

5000

2000

3000

Output: Account Number: 1234

Customer Name: Rahul Sharma

Final Balance: 4000.0

Answer

```
// You are using Java
import java.util.Scanner;
```

```
class CustomerAccount {
    private int accountNumber;
    private String customerName;
    private double balance;

    // Constructor
    public CustomerAccount(int accountNumber, String customerName, double
initialBalance) {
        this.accountNumber = accountNumber;
        this.customerName = customerName;
        this.balance = initialBalance;
    }

    // Getter methods
    public int getAccountNumber() {
        return accountNumber;
    }

    public String getCustomerName() {
        return customerName;
    }

    public double getBalance() {
        return balance;
    }

    // Setter methods (optional, can be used if updates are needed)
    public void setAccountNumber(int accountNumber) {
        this.accountNumber = accountNumber;
    }

    public void setCustomerName(String customerName) {
        this.customerName = customerName;
    }

    public void setBalance(double balance) {
```

```

        this.balance = balance;
    }

    // Method to deposit amount
    public void deposit(double amount) {
        if (amount >= 0) {
            balance += amount;
        }
    }

    // Method to withdraw amount
    public void withdraw(double amount) {
        if (amount <= balance) {
            balance -= amount;
        }
    }

    // Display method
    public void displayDetails() {
        System.out.printf("Account Number: %d\n", accountNumber);
        System.out.printf("Customer Name: %s\n", customerName);
        System.out.printf("Final Balance: %.1f\n", balance);
    }
}

class CityBankSystem {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);

        int N = Integer.parseInt(sc.nextLine()); // Number of customers

        for (int i = 0; i < N; i++) {
            int accNum = Integer.parseInt(sc.nextLine());
            String custName = sc.nextLine();
            double initialBalance = Double.parseDouble(sc.nextLine());
            double depositAmount = Double.parseDouble(sc.nextLine());
            double withdrawAmount = Double.parseDouble(sc.nextLine());

            // Create customer account object
            CustomerAccount customer = new CustomerAccount(accNum,
custName, initialBalance);

```

```
// Perform transactions
customer.deposit(depositAmount);
customer.withdraw(withdrawAmount);

// Display final details
customer.displayDetails();
}

sc.close();
}
```

1. Problem Statement

Neha is working as a developer for CityElectricity Board, which wants to build a household electricity billing system.

Each customer's electricity account has:

A Customer ID (integer) A Customer Name (string) Units Consumed (double)

The electricity bill is calculated based on these rules:

For the first 100 units 5 units charge per unit For the next 100 units (101–200) 7 units charge per unit For units above 200 10 units charge per unit If the total bill exceeds 2000 units, a 5% discount is applied on the final bill.

Neha has been asked to implement this system using:

A class with attributes for customer details. A constructor to initialize customer details. Setter methods to update details if needed. Getter methods to retrieve details. Objects of the class to represent customers.

Finally, display each customer's details and final bill amount.

Input Format

The first line of input contains an integer N, representing the number of customers.

For each customer:

- The next line contains the Customer ID (integer).
- The following line contains the Customer Name (string).
- The next line contains the Units Consumed (double).

Output Format

For each customer, print the details in the following format:

Customer ID: <customer_id>

Customer Name: <customer_name>

Final Bill: <final_bill> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

private int bookingId;
private String customerName;
private double distance;

// Constructor
public RideBooking(int bookingId, String customerName, double distance) {
    this.bookingId = bookingId;
    this.customerName = customerName;
    this.distance = distance;
}

// Getter methods
public int getBookingId() {
    return bookingId;
}

public String getCustomerName() {
    return customerName;
}

public double getDistance() {
    return distance;
}

// Setter methods (optional)
public void setBookingId(int bookingId) {
    this.bookingId = bookingId;
}

public void setCustomerName(String customerName) {
    this.customerName = customerName;
}

public void setDistance(double distance) {
    this.distance = distance;
}

// Method to calculate fare
public double calculateFare() {
    double baseFare = 50;
    double perKmRate = 10;
    double fare = baseFare + (distance * perKmRate);
}
```

```

        if (distance > 20) {
            fare = fare - (fare * 0.10); // Apply 10% discount
        }

        return fare;
    }

    // Display booking details
    public void displayDetails() {
        double finalFare = calculateFare();
        System.out.printf("Booking ID: %d\n", bookingId);
        System.out.printf("Customer Name: %s\n", customerName);
        System.out.printf("Final Fare: %.1f\n", finalFare);
    }
}

class CityCabFareSystem {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine()); // Number of bookings

        for (int i = 0; i < n; i++) {
            int bookingId = Integer.parseInt(sc.nextLine());
            String customerName = sc.nextLine();
            double distance = Double.parseDouble(sc.nextLine());

            RideBooking booking = new RideBooking(bookingId, customerName,
            distance);
            booking.displayDetails();
        }

        sc.close();
    }
}

Section 1 : Coding

1. Problem Statement

Ram is working as a developer for BrightEdu Coaching Center, which wants to build a student fee management system.

Each student's enrollment has:

An Enrollment ID (integer) A Student Name (string) The Number of Subjects (integer)

The fee calculation rules are:

Registration Fee = 1000 units (flat for every student). Per Subject Fee = 800 units. If the student enrolls in more than 5 subjects, a 20% scholarship (discount) is applied on the total fee.

Ram has been asked to implement this system using:

A class with attributes for student details. A constructor to initialize student details. Setter methods to update details if needed. Getter methods to retrieve details. Objects of the class to represent student enrollments.

Finally, display each student's details and final fee.

Input Format

The first line of input contains an integer N, representing the number of students.

For each student:

- The next line contains the Enrollment ID (integer).
- The following line contains the student's name (string).
- The next line contains the Number of subjects (integer).

Output Format

For each student, print the details in the following format:

- Enrollment ID: <enrollment_id>
- Student Name: <student_name>
- Final Fee: <final_fee> (rounded to one decimal place)

Refer to the sample output for formatting specifications.

Sample Test Case

Input: 1

1234

Ravi Kumar

3

Output: Enrollment ID: 1234

Student Name: Ravi Kumar

Final Fee: 3400.0

Answer

```
// You are using Java
import java.util.Scanner;
```

```
class StudentEnrollment {
```

```
private int enrollmentId;
private String studentName;
private int numberOfSubjects;

// Constructor
public StudentEnrollment(int enrollmentId, String studentName, int
numberOfSubjects) {
    this.enrollmentId = enrollmentId;
    this.studentName = studentName;
    this.numberOfSubjects = numberOfSubjects;
}

// Getter methods
public int getEnrollmentId() {
    return enrollmentId;
}

public String getStudentName() {
    return studentName;
}

public int getNumberOfSubjects() {
    return numberOfSubjects;
}

// Setter methods (optional)
public void setEnrollmentId(int enrollmentId) {
    this.enrollmentId = enrollmentId;
}

public void setStudentName(String studentName) {
    this.studentName = studentName;
}

public void setNumberOfSubjects(int numberOfSubjects) {
    this.numberOfSubjects = numberOfSubjects;
}

// Method to calculate final fee
public double calculateFee() {
    double registrationFee = 1000;
    double perSubjectFee = 800;
```

```

double totalFee = registrationFee + (numberOfSubjects * perSubjectFee);

if (numberOfSubjects > 5) {
    totalFee = totalFee - (totalFee * 0.20); // 20% scholarship
}

return totalFee;
}

// Method to display student details and final fee
public void displayDetails() {
    double finalFee = calculateFee();
    System.out.printf("Enrollment ID: %d\n", enrollmentId);
    System.out.printf("Student Name: %s\n", studentName);
    System.out.printf("Final Fee: %.1f\n", finalFee);
}
}

class StudentFeeManagement {
    public static void main(String[] args) {
        Scanner sc = new Scanner(System.in);
        int n = Integer.parseInt(sc.nextLine()); // Number of students

        for (int i = 0; i < n; i++) {
            int enrollmentId = Integer.parseInt(sc.nextLine());
            String studentName = sc.nextLine();
            int numberOfSubjects = Integer.parseInt(sc.nextLine());

            StudentEnrollment student = new StudentEnrollment(enrollmentId,
                studentName, numberOfSubjects);
            student.displayDetails();
        }

        sc.close();
    }
}

```
